## U225 Meso Gun

The French made U225 is the most sophisticated mesotherapy injector currently available on the market. This mesogun is one of the most popular mesotherapy guns available. It is **fully automatic**, powered by pneumatic pressure generated by an air compressor.

The U225 has **two basic modes of function** which allow continuous injection, intermittent injection a raffale and point-par-point.

In the intermittent mode, the user can vary the injection frequency from 1 every 3 seconds to 500 per minute. This versatility can practically satisfy any technique. The rate of injection is also easily adjustable.

### PNEUMATIC POWER:

The pneumatic power separates this device from all others in the field. This unique specification allows this device significant added power allowing faster injection (which can be an issue often with viscous cocktails) as well as faster needle movement.

The speed of needle allows a much faster skin puncture therefore rendering the needle entry virtually painless.

### USE:

This is another innovative feature. During the injection process only the needle moves back and forth. This is in contrast with most other devices where the needle and syringe move as a unit. This provides added stability and less vibration while injecting.

It is easy to understand how with only the needle moving the mass impact to the patient's skin is reduced consequently decreasing trauma and pain.
